

# PATTERN TRANSFORMATION

## HOUSING ESTATE - EUROSPAN

The presented proposal develops the role of a garden into a new communication type. If a garden in a house in a city is only a prolongation of a living room, these new green entrance halls or vestibules are a spatial matrix intertwining the public and private apartment spaces. The green vestibule is a common living room through which one enters the apartment. The vestibule is developed vertically. In the first type of residential clusters it is a prolongation of open green spaces, which form part of the terrain. In the second type of residential clusters, the green vestibule is a green hole in the flat lamella, and in the third it is a green space in front of the facade.
